DECLARATION

We hereby declare that the work, which is being presented in this dissertation entitled “**ERP Solution**” in partial fulfillment of the requirements for the award of the degree of **Bachelor of Technology in Computer Science and Engineering**, is an authentic record of work carried out by us.

The matter embodied in this report has not been submitted by us for the award of any other degree.

Amit Kumar

0818CS221021

Aditya Dewangan

0818CS221007

Amit Mankar

ABSTRACT

Educational institutions today handle a large number of academic, administrative, and financial activities every day. These include tasks like maintaining student records, managing attendance, handling fees, storing important documents, scheduling events, and monitoring academic performance. While many institutions use ERP (Enterprise Resource Planning) systems for this purpose, most existing solutions are rigid, have limited automation, and do not integrate with modern technologies such as Artificial Intelligence (AI), cloud storage, or real-time analytics. This often results in time-consuming processes, data duplication, and poor decision-making due to the lack of smart insights.

To address these issues, **CampusConnect** is proposed as a next-generation, web-based ERP platform designed specifically for educational institutes. It supports multiple user roles—Principal, Head of Department (HOD), Faculty, Students, Administration, and Accounts—each with a personalized dashboard and features relevant to their role. The system is built to improve communication, streamline workflows, and ensure data is accessible securely from anywhere.

ACKNOWLEDGEMENT

We take this opportunity to express our heartfelt gratitude to everyone who has supported us throughout the journey of completing our minor project.

First and foremost, we would like to thank the Head of the Department, **Dr. Richa Gupta**, for their encouragement, guidance, and providing us with all the necessary facilities to carry out this project.

We extend our sincere gratitude to our Project Coordinator, **Mr. Rakesh Jain**, for their continuous support, timely advice, and valuable feedback. We are deeply indebted to our Project Guide, **Mrs. Praveena Joshi**, for their expert guidance, valuable suggestions, and support throughout this project.

Thank you all for making this project a meaningful and enriching experience.

Amit Kumar

Chapter 1

Introduction

1.1 Background

In recent years, educational institutions have rapidly adopted digital transformation to improve academic management, communication, and operational workflows. However, many still rely on fragmented or outdated ERP systems that fail to provide seamless integration, intelligence, and flexibility. As student numbers grow and education becomes more personalized, the need for a centralized, scalable, and intelligent ERP platform is more critical than ever.

Campus Connect has been developed as an integrated ERP platform for educational institutions. It centralizes academic operations through role-based dashboards for Admin, Teacher, and Student, enabling seamless coordination and management. With features like QR-based attendance, digital assignment handling, and real-time communication, the system automates manual tasks while improving data accuracy, accessibility, and transparency across the campus. Chatbot using google Gemini for user support and navigation. Student Performance Prediction System using historical attendance and marks (ML model in Python). For faculty only, An AI agent's system to automate the task given in natural language like showing students list, uploading assignments etc.

1.2 Problem Statement

Despite various ERP solutions in the market, the following challenges persist:

- **Fragmented Data Management:** Most institutes rely on separate systems for attendance, assignments, and student records, which leads to data inconsistency and duplication across departments.
- **Inefficient Document and Request Handling:** Manual processing of MoU's, certificates, and student queries causes delays and errors.
 - **Limited Mobile Accessibility:** Many systems lack offline

access, installable interfaces, and mobile-first experiences.

- **Outdated Attendance Systems:** Manual or RFID-based systems are either error-prone or expensive.
- **No Centralized Document Storage:** Document tracking is not secure or scalable.

1.3 Purpose/Objective

The main goals of this project are:

- Develop a role-based, centralized ERP platform accessible via desktop and mobile browsers.
- Integrate AI Chatbot to assist users in real time with queries, documentation, and portal navigation.
- Build a Student Performance Prediction System to help faculty identify at-risk students early.
- Deploy a Recommendation Engine to suggest personalized notes, courses, and resources.
- Implement Cloud-Based Document Storage for secure upload, retrieval, and archival.
- Support QR Code-Based Attendance to ensure quick and tamper-proof attendance tracking.
- Create a Smart Calendar to notify users of deadlines, assignments, and institutional events.
- Enable PWA Support to allow offline capabilities and installable app-like experience.

1.4 Solution Approach

The proposed platform will follow a modular, scalable architecture:

- Frontend: Built using React.js with Tailwind CSS for a fast and responsive UI, and PWA features (offline support, installable on devices).
- Backend: Node.js + Express.js for business logic and API services, Python FastAPI for AI-based modules. Offline attendance sync mechanism using scan delay reconstruction and QR timestamp validation.
- Database: MongoDB for handling all structured/unstructured data (student records, documents, logs).
- Cloud Integration: Firebase and AWS S3 for document storage.

Third-Party APIs:

- Node Mailer – For OTP-based email verification.
- qrcode (npm) – For QR code generation in attendance.
- Socket.IO – For real-time updates and notifications.
- Multer – For handling file uploads.

1.5 Scope of the Project

- **Faculty:**

Upload notes, create assignments, view student analytics, take attendance via QR, respond to MoU requests.

- **Students:**

View attendance, assignments, schedules, documents, pay fees, request MoU access, get AI-based suggestions.

- **Admin:**

Manage all institutional records, documents (ID proofs, MoUs), compliance status, cloud backups.

1.6 Existing Systems

Systems like Edu flex, and MyClassCampus offer ERP capabilities but lack:

- AI-based personalization and analytics
- Chatbot assistants
- Real-time cloud document management
- QR-based attendance and PWA support

1.7 Limitations of Current Systems

- Static document uploads with no cloud backup or retrieval history
- Time-consuming student tracking with no predictive analytics
- Poor mobile support and lack of offline capabilities
- Lack of a centralized query system (like for MoUs)
- Repetitive manual attendance marking processes

Chapter 2

Methodology

2.1 Proposed Methodology

CampusConnect is developed using the **Iterative Waterfall Model**. This model works in steps like the normal waterfall process but allows us to go back and make changes after reviewing each stage.

Fig 2.1- Iterative Waterfall Model

Steps followed:

- **Requirement Gathering** – Collect needs from principals, faculty, admin staff, and students. Prepare a list of features, user roles, and workflows.
- **Design** – Create system structure, database design, page layouts, and module flowcharts.
- **Development** – Build each module using React.js (frontend), Node.js/Express (backend), and Python (AI features).
- **Integration** – Connect the core system with AI chatbot, QR attendance, and cloud storage.
- **Testing** – Check each feature with test cases, fix errors, and ensure smooth working.
- **Deployment** – Host the system on a cloud server for real-time access.
- **Monitoring** – Keep track of performance and make updates or fixes when needed.

2.2 Process Model Adopted

The **Iterative Waterfall Model** is chosen because:

- It keeps the work organized in steps.
- Problems are found and fixed early.
- Users can review progress after each stage.
- Changes can be made without starting over.

Example: After designing the QR attendance system, it can be tested with a small group of teachers and students before launching for all.

2.3 Planning and Scheduling

Phase	Duration	Work Done
Requirements & Design	1 Week	Gather needs, create system design, database plan, and page layouts.
Core Module Development	3 Week	Build login, dashboards, timetable, fees, and academic record modules.
AI Features & Integrations	2 Week	Add AI chatbot, performance prediction, and calendar features.
Admin & QR/Cloud Systems	2 Week	Add QR attendance, cloud storage, and admin controls.
Testing & Deployment	1 Week	Test the system, fix issues, deploy on cloud, and train staff.

Table: 2.3.1 Planning and Scheduling

Chapter 3

Requirements and Analysis

3.1 Problem Definition

Educational institutions often use outdated ERP systems that are slow, hard to customize, and lack modern technology support. The aim of CampusConnect is to build a modern ERP platform that:

- Works smoothly on both computers and mobiles (PWA support).
- Uses AI to give smart recommendations and automate tasks.
- Stores and manages data securely on the cloud.
- Improves communication and workflow between students, teachers, admin staff, and management.
- Attendance systems need to be secure, proxy-proof, and functional even in low-network classrooms.

3.2 Feasibility Study

3.2.1 Technical Feasibility

- The chosen technology stack (React.js, Node.js, MongoDB, Flask) is already used in many real-world applications.
- These tools are scalable, meaning more features can be added without rebuilding the system.
- Large community support means issues can be solved quickly.

3.2.2 Economic Feasibility

- Most tools and frameworks are open-source (free to use).
- Uses free-tier cloud hosting initially to keep costs low.
- Maintenance costs are minimal since updates can be made remotely.

3.2.3 Operational Feasibility

- The interface is easy to use, so training time for staff is very short.
- Each role (student, teacher, admin) has a separate dashboard showing only relevant features.
- The system can run on basic hardware and standard internet speeds.

3.3 Functional Requirements

Student Module

- View attendance, assignments, and study notes.
- Get AI-based study tips and performance alerts.
- Request to registered faculty for queries again MoUs.

Faculty Module

- Upload study material and assignments.
- Dynamic QR attendance with time-window validation, offline support, and a grace window to allow last-second scans while preventing proxy attempts.
- Mark and track student attendance via QR.
- AI Agent automates faculty tasks using natural language commands (e.g., 'show student list', 'upload notes').
- Respond to student requests for assignments and MoUs.

Admin Module

- Add and remove Student and Faculty.
- Upload and store documents in the cloud.

AI/ML Requirements

- AI chatbot for teacher/student support using Google Gemini.

3.4 Non-Functional Requirements

- Performance: System should respond within 2 seconds for most actions.
- Availability:
 - Offline-first QR attendance scanning with local storage and delayed sync.
 - Scan-delay logic ensures valid attendance marking without internet.
- Security:
 - JWT for user authentication.
 - RBAC (Role-Based Access Control) to ensure correct permissions.
 - Availability: Cloud hosting ensures 24/7 uptime.
 - Secure time-window validation ensures QR codes cannot be reused or shared.
 - Attendance verification uses QR timestamp + scan delay, preventing proxy attempts.

3.5 Technical Requirements

3.5.1 Hardware Requirements

- Minimum: Dual-core processor, 4GB RAM, 500GB HDD.
- Recommended: Quad-core processor, 8GB RAM, SSD for faster loading.

3.5.2 Software Requirements

- Operating System: Windows, Linux, or MacOS.
- Tools & Frameworks: Node.js, Python, MongoDB, React.js.
- Browser Support: Chrome, Firefox, Edge, Safari.

3.5.3 Network Requirements

- Stable connection for QR attendance and cloud file uploads.

Chapter 4

Technology Stack

4.1 Front-End Technology

- **React.js** – Used to build the user interface (dashboards, forms, menus). It makes the system fast, smooth, and easy to manage.
- **Tailwind CSS** – Used for styling the pages. It helps create a clean and mobile-friendly design quickly.
- **TypeScript** – Helps in writing safer code by catching errors early. This makes the system more reliable.

4.2 Back-End Technology

- **Node.js + Express.js** – Handle server tasks, process requests, and manage many users at the same time.
- **Flask (Python)** – Used for Artificial Intelligence (AI) features like performance prediction and chatbot.

4.3 Database

- **MongoDB (NoSQL)** – Stores all records such as student details, attendance, fees, and documents.
- Data is stored in flexible documents (not fixed tables) so it is easy to manage different types of data.

4.4 APIs and Other Tools

- **GPT API** – For AI chatbot to help students, teachers, and staff in real-time.
- **Google Calendar API** – For reminders, scheduling classes, and important events.
- **Firebase / AWS S3** – For storing files like ID proofs, certificates, and MoUs in the cloud safely.
- **QR Scanner** – For fast and secure attendance using QR codes.
- **Dynamic QR** generation using qrcode (npm), time-window verification logic, and offline scan-delay calculation.
- **AI Agent System:** Natural Language Processing with Gemini/GPT-based automation.

Chapter 5

Result Analysis

5.1 Comparative study of results

5.1.1 Process Efficiency

The introduction of QR-based attendance drastically reduces the time required for faculty to mark attendance, making the process nearly instantaneous compared to manual or RFID-based systems.

Uploading and sharing assignments, notes, and schedules through centralized cloud storage makes academic resource distribution faster, organized, and easily accessible for students.

Automated fee management and reminders significantly cut down manual data entry errors, streamline payment tracking, and reduce workload for the accounts department.

5.1.2 User Experience & Accessibility

CampusConnect provides a modern, intuitive, and responsive UI, ensuring smooth access across desktops and mobile devices through PWA support.

Students benefit from a single dashboard that consolidates attendance, notes, fee status, schedules, and documents—making navigation simple and efficient.

5.1.3 Intelligence & Automation

The AI-based student performance prediction system analyzes attendance, assignment submissions, and academic history to provide early warnings for academically weak students, enabling timely intervention.

Personalized recommendation features guide students toward the right study materials, notes, and academic activities, improving overall learning engagement and productivity.

Smart calendar integration with automated reminders ensures students and faculty never miss deadlines, classes, or important institutional events, enhancing time management.

5.1.4 Transparency & Data Management

Document management ensures documents such as MoUs, certificates, notes,

and IDs are stored securely and can be accessed anytime, improving data reliability and tracking.

The automated MoU request and approval system creates transparency by eliminating physical paperwork and providing real-time tracking of request status.

Faculties gain a 360-degree view of Student activity through analytics dashboards, enabling informed decision-making and improved oversight.

5.1.5 Overall Improvements Compared to Existing Systems

Integrates AI and ML, making the ERP significantly smarter and more adaptable than conventional systems.

Enhances accessibility with PWA, mobile support, and real-time updates.

Improves academic transparency, as students, faculty, and management all access up-to-date records easily.

A scalable and modular design allows easy integration of new features in the future (AI expansions, new departments, or multi-campus support).

Chapter 6

Conclusion and Future Scope

6.1 Conclusion

CampusConnect is designed to be a **modern, AI-powered ERP system** for educational institutions.

- It combines **automation, smart analytics, and cloud storage** to make daily operations faster and more accurate.
- Students can easily access attendance, assignments, and notes from any device.
- Teachers can manage attendance, share study materials, and track student performance effortlessly.
- Admin staff can handle fee payments, documents, and reports in one place.
- The system is mobile-friendly and supports role-based dashboards, so each user only sees the features they need.
- The time-window and grace-window logic guarantees accurate validation without penalizing genuine students.

Overall, **CampusConnect** aims to **reduce manual work, improve communication, and enhance decision-making** in schools and colleges.

6.2 Limitations / Constraints

- **Dependence on Third-Party APIs**
 - Certain features (AI chatbot, cloud storage, calendar sync) rely on external services like Google APIs or cloud providers.
 - If these services change pricing, limit access, or have downtime, some features might be affected.
- **Initial Version Limited to Web Deployment**
 - Currently, CampusConnect runs only in a web browser.
 - It works well on mobile browsers (PWA) but does not have fully native mobile apps yet.

6.3 Future Work

- Native Android and iOS Applications
 - Develop mobile apps for better offline access, faster performance, and push notifications.
- AI-Generated Lecture Notes and Summaries
 - Automatically create lecture notes from recorded classes or teacher uploads.
 - Provide short summaries for students to revise quickly before exams.
- Blockchain-Based Secure Academic Records
 - Store student grades, certificates, and documents on blockchain for tamper-proof security.
 - Allow institutions to verify credentials instantly.
- Multi-Campus Management
 - Extend the system so universities with multiple campuses can manage all locations from a single platform.
 - Centralized reports and communication between campuses.
